Safe Environment Engineering Releases Free GateWay Detect Software

Problem: First responders use a variety of data networks to receive incident information via the Internet. Routing critical life saving information is made reliable by the availability of multiple Internet connections, e.g. satellite, cellular or WiFi. In many cases the current connection type in use is not made known to the user by on-board equipment.

Solution: Safe Environment Engineering (SEE) Gateway Detect software solves the problem by detecting whether the method of network routing is via satellite, cellular, or WiFi. The software also determines the number of network hops and type of devices between the user's computer and the Internet destination. This routing information is visually displayed on the user's desktop computer.

Our gateway detect software is available for free download upon request and registration.
